

A FEMs sharpen spatial coding

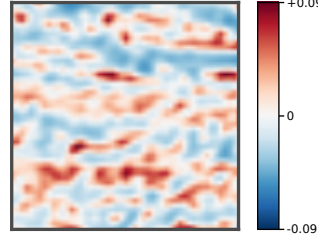

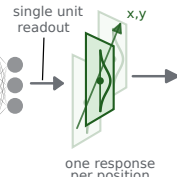

FEM jittered movie

Stabilized movie

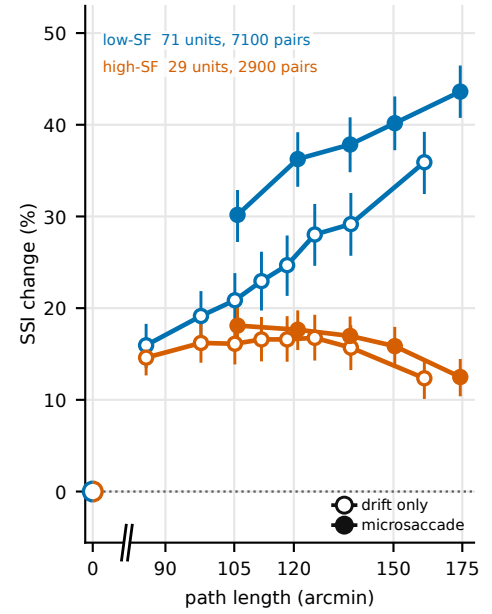

FEM response map
SSI = 0.14 bits/spike

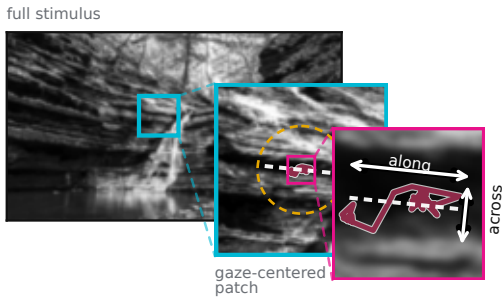

stabilized response map
SSI = 0.10 bits/spike

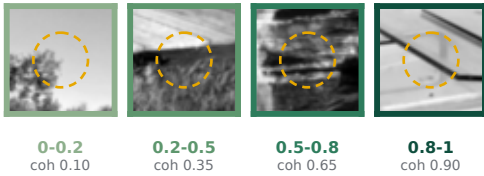

B Path length separates low- and high-SF benefit

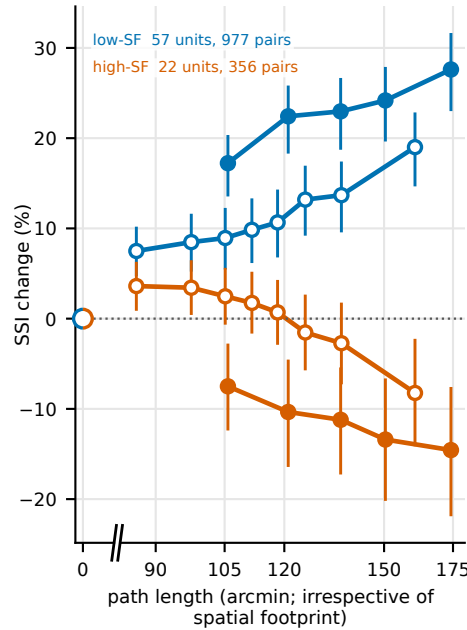

C Local contours define the relevant image axis

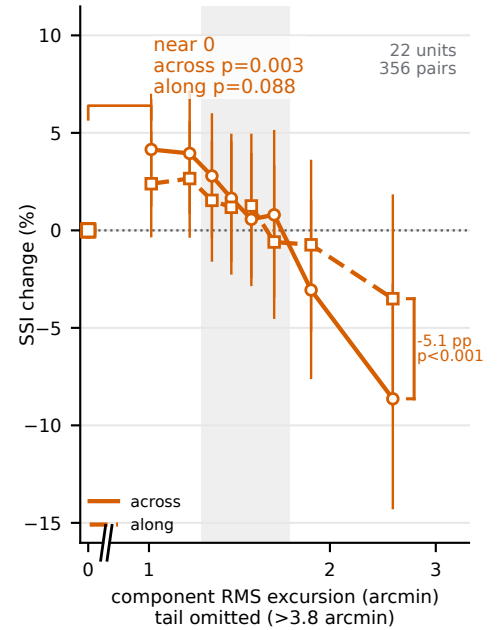

Per fixation: local contour axis and strength (coherence) vary

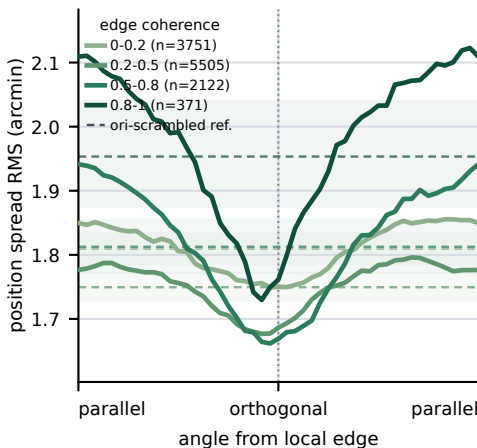

D Contour alignment exposes a high-SF limit

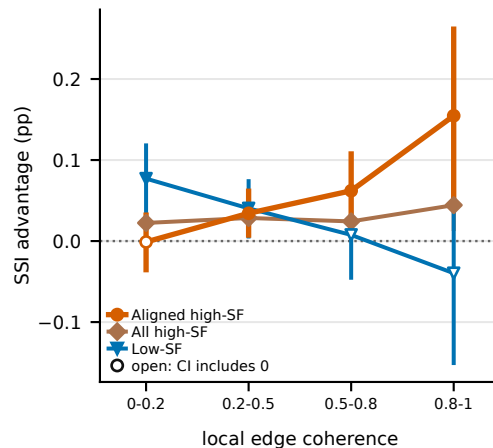

E Across-contour spread limits high-SF benefit

F Real FEM spread is contour-aligned

G Contour-matched FEMs beat rotations for aligned high-SF units

H Edge following saturates near foveal scale
