

Single-spike information and contour-relative FEM

A Motion sharpens unit activations across space

FEM jittered movie

Stabilized movie

B Low-SF units

C High-SF units

D Unit tuning interacts with local image content

E Low-SF aligned units

F High-SF aligned units

G Effects of FEMs depend on both content and tuning

Reference crop + zoomed aperture from D. RMS excursion, by direction

H High-SF aligned units' information depends on trajectory shape

I Real FEMs are anisotropic near local contours

J Real (vs. randomly rotated) FEM trajectories preferentially benefit aligned high-SF units
